Umugwaneza Olive

In this example, replace `"example.pdf"` with the actual URL or relative path of the PDF file you want users to download. Also, update the `download` attribute value to set the desired filename for the downloaded file.

The `download` attribute tells the browser that the link should be downloaded instead of navigating to it directly. When users click on the "Download PDF" link, their browser will initiate the download of the PDF file.

Make sure the PDF file is accessible and available at the specified URL or path. If you want to host the PDF file on your server, make sure it's in the same directory as the HTML file or specify the correct relative path to it.
